Construction of the international space
station, scheduled to start in late 1998,
ushers in a new era for laboratory sciences
in space. This is especially true for space

life sciences, which include not only the use of low gravity as an experimental parameter to study fundamental biological processes but also the study of the serious physiological changes that occur in astronauts as they remain in space for increasingly longer missions. This book addresses both of these aspects and provides a comprehensive review of ground-based and space research in eleven disciplines, ranging from bone physiology to plant biology. It also offers detailed, prioritized recommendations for research during the next decade, which are expected to have a considerable impact on the direction of NASA's research program. The volume is also a valuable reference tool for space and life scientists.

Mechanisms of Vessel Development: From a Primitive Draft to a Mature Vasculature John Benjamins Publishing

In recent years, a lively debate ensued on

an old issue, namely the proper distinction between semantics and pragmatics against the background of the classical Gricean distinction between what is said and what is implicated. From a linguist's point of view, however, there has always been a regrettable lack of empirical data in this otherwise sophisticated debate. Recently, a new strand of research emerged under the name of experimental pragmatics, the attempt to gain experimental data on pragmatic and semantic issues by using psycholinguistic and neurolinguistic methods. This volume brings together work by scholars engaging in experimental research on the semantics/pragmatics distinction. The contribution of experimental pragmatics to pragmatic and semantic theory is discussed from a number of different angles, ranging from implicature and pragmatic enrichment to pragmatic acquisition, pragmatic impairment, and pragmatic processing. In addition, methodological issues are discussed. The contributions will appeal to theoretical linguists, psycholinguists, neurolinguists, and language philosophers."

The Really Useful Book of Science

Experiments contains 100 simple-to-do science experiments that can be confidently carried out by any teacher in a primary school classroom with minimal (or no!) specialist equipment needed. The experiments in this book are broken down into easily manageable sections including: It's alive: experiments that explore our living world, including the human body, plants, ecology and disease A material world: experiments that explore the

materials that make up our world and their properties, including metals, acids and alkalis, water and elements Let's get physical: experiments that explore physics concepts and their applications in our world, including electricity, space, engineering and construction Something a bit different: experiments that explore interesting and unusual science areas, including forensic science, marine biology and volcanology. Each experiment is accompanied by a 'subject knowledge guide', filling you in on the key science concepts behind the experiment. There are also suggestions for how to adapt each experiment to increase or decrease the challenge. The text does not assume a scientific background, making it incredibly accessible, and links to the new National Curriculum programme of study allow easy connections to be made to relevant learning goals. This book is an essential text for any primary school teacher, training teacher or classroom assistant looking to bring the exciting world of science alive in the classroom.

Comprehensive Basic Electrical Engineering DigiCat

This book is the first attempt to validate

behavior modification techniques in a carefully controlled experimental treatment environment for emotionally disturbed children. Such special settings permit carefully conducted research experiments can be carried out. This is the first book to synthesize scientific and clinical approaches to human behavior, indicating that behavior modification may one day be as much an applied science as engineering or medicine. This experimental approach introduces scientific rigor to the clinical setting, as evidenced by precise measurement of behavior variables, detailed specification of treatment procedures, and the use of sophisticated experimental designs to provide objective evaluation of the effectiveness of treatment programs. In this approach, series of idiographic (single-subject) case studies are conducted in a precise manner with each patient-subject admitted to the treatment program. The general research methodology is similar to that used in the broad area of operant conditioning, and most work reported in the book was conducted within a learning theory or behavior-modification framework. Browning and Stover discuss

the general problems of developing and controlling a total therapeutic milieu, presenting practical discussions of problems of data collection, decisions about treatment programs to be used, staffing problems, and documental opinion on the relative values of various treatment techniques. Throughout attention is devoted to developing a method for answering common questions of parent, child-care worker, and professional. The authors conducted symposia on the material contained in this book at various national and regional meetings and have lectured extensively on college campuses. It is a ground-breaking study.

The Study of Elementary Electricity and Magnetism by Experiment CRC Press

This book draws upon empirical data collected from 10,000 adolescent young people in 10 European countries. The first volume of this project was about young people's life perspectives and the second about their religious attitudes and practices. The current and final volume of this cross-cultural study connects both research dimensions. The analyses make clear that the influence of religion on

values, life-orientation and politics differs strongly between different groups within Christianity and between Christians, Jews and Muslims. Many findings contain obvious surprises because they refute mainstream opinion on many topics. The book gives detailed and new insights in the public relevance of the religiosity of young people across Europe. All three volumes together are indispensable for scholars who work in public, religious and educational contexts.

This proven lab manual offers a unique blend of laboratory skills and exercises that effectively illustrate concepts from the main text, CHEMISTRY FOR TODAY: GENERAL, ORGANIC, AND BIOCHEMISTRY, 8th and 9th Editions. The book's 15 general chemistry and 20 organic/biochemistry safety-scale laboratory experiments use small quantities of chemicals and emphasize safety and proper disposal of materials. 'Safety-scale' is the authors' own term for describing the amount of chemicals each lab experiment requires -- less than macroscale quantities, which are

expensive and hazardous, and more than microscale quantities, which are difficult to work with and require special equipment. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

The 48 experiments in this well-conceived manual illustrate important concepts and principles in general, organic, and biochemistry. As in previous editions, three basic goals guided the development of all the experiments: (1) the experiments illustrate the concepts learned in the classroom; (2) the experiments are clearly and concisely written so that students will easily understand the task at hand, will

work with minimal supervision because the manual provides enough information on experimental procedures, and will be able to perform the experiments in a 2-1/2 hour laboratory period; and (3) the experiments are not only simple demonstrations, but also contain a sense of discovery. This edition includes many revised experiments and two new experiments. Important Notice: Media content referenced within the product description or the product text may not be
